

IT MANAGEMENT AND SUPPORT CONTRACTS

You'll probably agree that you should be spending your valued time on the day-to-day running of your business rather than worrying about IT issues, which is why we have created a flexible and comprehensive 'Fully Managed Service' that you can rely on to keep things working.

One of the principal aims of your business is probably going to be to help it grow. Whether your business is just starting or firmly established, you will have IT needs. As your business grows, so too will these IT needs, which is why choosing the right IT provider is such a critical decision.

Is a fully managed service 'overkill' or is it what I need?

In an ever-increasingly complex IT industry, growing your business can appear to be extremely difficult when you look at the huge range of hardware, software and services available. Keeping yourself or your team up-to-date is time consuming and often expensive. If you have no interest in such things, or you're having trouble keeping up, a cost effective (and fixed price!) fully managed services will work wonders for you.

The following are elements every business owner should consider when choosing an IT services provider:

1. Billing Structure.

2. Bespoke Service.

3. Response Times.

4. Qualified and experienced staff.

5. Data storage and security expertise.

6. Experience and reviews.

What to consider when choosing an IT services provider:

1. Billing Structure.

Typically, fixed-price contracts are the preferred way to go over a pay-as-you-go system. With this option, you know exactly how much you are paying your IT provider each month. This option also provides ongoing monthly support and allows for the increase or decrease of staff and associated resources by the adjustment of the monthly fee.

This billing structure also gives you the advantage of reviewing your IT processes on an ongoing basis for any improvements or necessary modifications.

2. Bespoke Service.

Every business has different needs. It is therefore imperative to look for an IT Provider capable of customising solutions and services to suit your business. This involves putting together a well-tailored and comprehensive solution that meets the needs of your business. Overall, it would aim to overcome any challenges you might be facing and cut out unnecessary costs in the process.

3. Response Times.

Any IT service provider should be able to give you an estimate of response times in any given situation. This includes logged IT issues that need to be resolved, or onsite support that requires immediate attention. It will allow you to assess whether their response times and availability meet your business requirements.

4. Qualified and experienced staff.

Having access to a team of highly trained and experienced technicians, constantly up to date with the latest technologies, will ensure the best IT solution for your business.

An IT providers with credible work experience in your specific industry is better equipped to anticipate your operational needs and foresee potential problems before they arise.

5. Data storage and security expertise.

With more people working from home and cybercrime on the rise, cybersecurity has never been more important. Your IT service provider can protect your network and business as a whole; including viruses, malware, and any form of a security breach that may compromise sensitive company data. Your IT provider should be well equipped to block data intrusions and eliminate cyber threats before they penetrate your network. They may also be able to take the responsibility to helping you maintain IT security compliance for industry and government regulations.

6. Experience and reviews.

Verify the company's industry experience and customer service skills before you choose your IT provider. They should also be able to provide you with clear examples of work with similar businesses in your industry. This will provide insight into how good your IT provider is at service delivery and customer satisfaction.

Our services include:
